

SQL Server Daily Health Check - Sample Output

Example only - values and server names are fictitious

Summary

Server	Generated	Check	Status	Details
SQLPROD-DEMO	2026-08-23 08:05	Instance Health	PASS	No recent restart warning detected.
SQLPROD-DEMO	2026-08-23 08:05	Database Status	PASS	0 database(s) are not ONLINE.
SQLPROD-DEMO	2026-08-23 08:05	Backup Health	WARNING	1 database outside configured backup thresholds.
SQLPROD-DEMO	2026-08-23 08:05	SQL Agent Jobs	PASS	0 failed job outcomes in last 24 hours.
SQLPROD-DEMO	2026-08-23 08:05	Transaction Log	PASS	0 databases at/above log threshold.
SQLPROD-DEMO	2026-08-23 08:05	Blocking	WARNING	1 blocked request above 60 seconds.
SQLPROD-DEMO	2026-08-23 08:05	Long Requests	PASS	0 requests above configured duration.
SQLPROD-DEMO	2026-08-23 08:05	Always On	INFO	HADR not enabled on this instance.

Example follow-up: Backup Health

The summary reported one database outside the configured threshold. The DBA then runs `03-Backup-Health.sql` and validates the finding against the approved backup policy.

Database	Recovery	Last Full	Last Log	Severity	Recommended action
OrdersDB	FULL	2026-08-21 22:00	2026-08-23 07:52	WARNING	Full backup age exceeds example threshold. Validate job and policy.
ReportingDB	SIMPLE	2026-08-23 01:00	N/A	PASS	Within example policy.

Example follow-up: Blocking

The blocking check is a point-in-time observation. The DBA reviews the blocker, transaction context, application impact, wait details, and rollback risk before any intervention.

Example: Blocked session 84 | Blocking session 71 | Database OrdersDB | Wait 184 seconds | Severity WARNING

Important

This sample demonstrates how to interpret the toolkit. It is not a benchmark, SLA, or universal threshold recommendation. Replace all example thresholds with values approved for your environment.
